Alex Ivanov

alex@ivanov.es

Summary

Staff software engineer with 20+ years of experience building developer tools, testing infrastructure and AI platforms. Most recently led quality evaluation for an LLM product at Google, covering eval infrastructure, eval set curation and large-scale analysis of production conversations. Track record of driving company-wide adoption through technical leadership and cross-functional collaboration.

Professional Experience

Google

Jun 2019 - Current

Staff Engineer

AI Quality and Evaluation, 2025 - Current

- Tech lead for quality on Google's largest internal AI chat assistant outside of coding tools. Set up quality monitoring and validation, built the evaluation infrastructure, and owned curation and ongoing refresh of eval sets.
- Designed and deployed a privacy-preserving analytics platform that classifies user conversations across multiple dimensions, scaling to 90K users, 250K conversations a day and 10M messages a week. It enabled continuous quality monitoring, tied eval sets to real production traffic, and pinpointed areas where quality lagged, all without anyone reading raw conversations.
- Headed observability and evaluation for Google's AI-assisted code migration platform, used by 100+ teams for large-scale code transformations. Created the evaluation infrastructure that ensures migration quality across 100K+ generated changelists.

Configuration Testing and Analysis, Jun 2019 - 2025

- Defined the technical strategy for configuration safety and ran a cross-functional working group that streamlined configuration changes across Google. Delivered a validation framework that now protects 1M+ configurations company-wide and prevents production incidents daily.
- Unified multiple testing frameworks into a single extensible tool with no loss of functionality or coverage, and integrated it with all internal frameworks. The tool now serves 100K+ developers, running 1M+ tests and 10M+ test runs a day.
- Led a team building configuration analysis and testing tools; mentored engineers and set best practices for the area.
- Introduced a new approach to configuration testing, presented at SPLASH 2023, arguing that configuration should be treated as a first-class programming language.

Apple

Jun 2014 - May 2019

Senior Software Engineer

- Drove design and delivery of the localization management tool for iTunes, supporting its international storefronts.
- Developed a synthetic iTunes client that generated realistic traffic and end-to-end tests for the platform.
- Shipped core iTunes commerce features, including the App Store on Apple TV.

Thinkorswim

Jan 2011 - Jun 2014

Senior Software Engineer

- Architected and implemented the thinkScript compiler and its supporting infrastructure, letting traders write their own indicators and strategies.
- Wrote the compiler's test suite, improving code quality and team productivity.

Deutsche Bank

Jun 2008 - Dec 2010

Senior Software Engineer

- Senior Java developer and architect on AutobahnFI, the bank's fixed income trading platform.
- Engineered several platform components, including a scalable order matching engine.

Earlier Experience

Jan 2005 - Jun 2008

- **Yandex**, Java Software Engineer (2007-2008): extended the company's internal JIRA deployment with core patches and custom plugins, improved its performance, and integrated it with internal services.
- **Vita-plus**, Software Engineer (2005-2007): built operations software for a regional drugstore chain.
